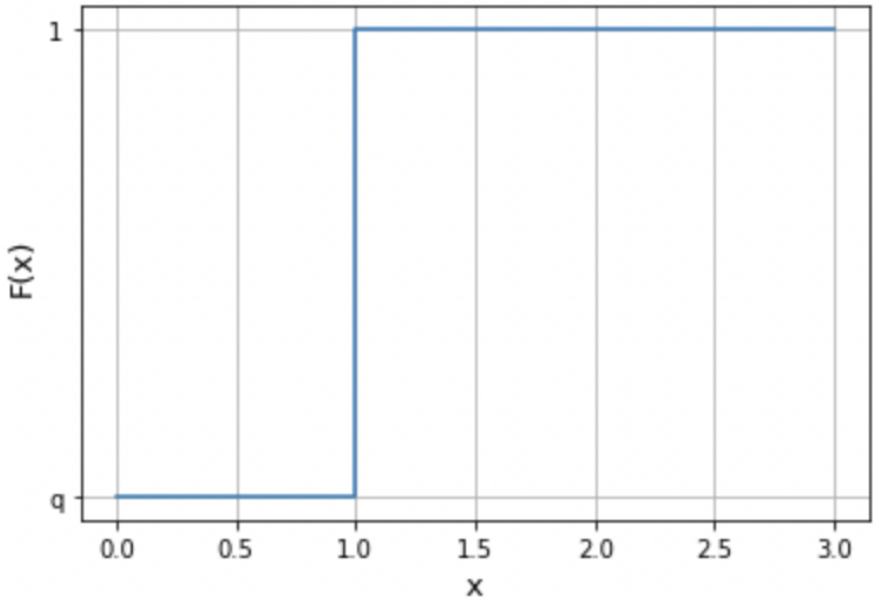
Outline

1. Problem
2. Solution

Problem

In the coin-tossing experiment, the probability of heads equals p and the probability of tails equals q. We define the random variable x such that x(h)=1, x(t)=0
We shall find it's distribution function F(x) for every x' from $-\infty$ to ∞.
If $x \geq 1$, then x(h)=1 $\leq$ x and x(t)=0 $\leq$ x.
Hence $F(x)=P\{x \leq x\} = P(h,t)=1$, $x \geq 1$

Solution



If $0 \leq x \leq 1$, then x(h)=1 and x(t)=0 $\leq$x. Hence
F(x)=P$\{x \leq x\}$ = P$\{t\}$=q , 0$\leq$ x $\leq$1.
If x<0, then x(h)=1 $>$ x and x(t)=0 $>$ x. Hence,
F(x)=P$\{x \leq x\}$=P$\theta\}$ = $0, x < 0$
